

Task 1 — InstaClone-SG

Steps

1. Open EC2 → Security Groups.
2. Select Create security group.
3. Name:
 - InstaClone-SG
4. Select your VPC.
5. Add HTTP:
 - Protocol: TCP
 - Port: 80
 - Source: YOUR_PUBLIC_IP/32
6. Add HTTPS:
 - Protocol: TCP
 - Port: 443
 - Source: YOUR_PUBLIC_IP/32
7. Configure outbound access according to your lab requirement.
8. Create the security group.

Task 2 — Backend MySQL Security Group

Create:

- Zomato-Backend-SG

Allow:

- Type: MySQL/Aurora
- Port: 3306
- Source: SPECIFIC_IP/32

Do not add broad inbound rules such as:

- 0.0.0.0/0

for a database.

Task 3 — Strict Outbound Traffic

The assignment asks for only:

- DNS → 53
- HTTPS → 443

Task 4 — Security Groups vs Network ACLs

Feature	Security Group	Network ACL
Applied to	EC2/network interfaces	Subnet
State	Stateful	Stateless
Rules	Allow rules; traffic is allowed if permitted	Supports allow and deny rules
Direction	Inbound and outbound	Inbound and outbound
Common use	Protect individual resources	Control subnet-level traffic
